Getting Started with Data Science and Generative A

Autor: Nucotbangalore - 2026/10/27 08:45

Data science combines programming, statistics, and data analysis to help people understand information and solve practical problems. Beginners can start with Python and SQL, then explore data cleaning, visualisation, and machine learning. Generative AI introduces additional possibilities for working with text, code, and other types of data.

For learners exploring these subjects, hands-on projects can help connect theoretical concepts with practical applications. NUCOT's Data Science with Python and Generative AI course is one program that learners can review when comparing learning options in Bangalore.
